

STOCK TRACKER LINK

Steps for Coleisha and Simar. The aim is a fixed doorway between the website and the stock tracker, so Simar can keep changing the script without breaking the site. Nothing gets built at the meeting. The output is one agreed field list.

SIMAR before the meeting

1. Add a **product code** column to the Database Products tab and fill it for every active row. Same code as the WooCommerce SKU where one exists; make one up in the same style where it doesn't.
2. Add rows for **Sinai Pearl** and for each of the **six cladding colours** (currently one row).
3. Decide where "**available**" comes from: a column someone keeps, or a formula from your movements. Either is fine, but pick one.
4. Make a **test copy** of the sheet and script with a handful of products and made-up stock.

COLEISHA before the meeting

1. Open the site preview and note how each product is sold: per pack, per slab, per box, per bucket. **Mixed patio packs can be split** into their four slab sizes; this is the case the sheet must handle.
2. Print the two field tables on the next page.
3. Bring the list of **five listings that disagree with the sheet** (item 10 of the handover), so Simar can say which is right.

TOGETHER about 30 minutes, the sheet open

1. Go down the **Read stock** table. For each field, write which column it comes from and what a blank means.
2. Go down the **Record order** table. Agree how a split pallet is recorded, and whether stock drops when an order is recorded or when it leaves the yard.
3. Agree the **four things Simar keeps stable** from now on: the web app address, the shared secret, the two entry point names, the field names. Everything else in the script is his to change.
4. Agree how he tells us about changes. A **Changelog** tab in the sheet is enough.

AFTER

- Coleisha writes the agreed list up and sends it to Fee. Fee connects the site to the test copy first, then the live one.
- Simar deploys the two entry points as a Google web app on **one permanent address** (deploy once, then publish new versions to the same deployment) and gives the address and the secret to Fee by phone, not email.

Questions to settle in the room. Is stock counted in slabs or in pallets? When a customer takes nine loose slabs from a pallet, how is the broken pallet recorded? Does stock drop when an order is recorded or when the goods leave the yard?

FIELD LIST

READ STOCK what the script returns, per product

FIELD	FROM THE SHEET	NOTES
code	new column	Must match the WooCommerce SKU. Settle this first.
name	Material + Colour	As the yard says it, e.g. "Sandstone Raj Green".
size	Size	Text as it stands.
thickness	Thickness	Text as it stands.
base_unit	Base Unit	Slab, box, bucket, piece.
mode	Mode	fixed or mixed pack.
per_pallet	Units Per Pallet	Whole number.
per_box	Units Per Box	Whole number, 0 if not boxed.
m2_per_unit	SQM Per Unit	Number, 0 for non-paving.
available	new column or formula	Whole units on hand and not allocated. Simar decides column or calculation.
active	Active	YES/NO, so a discontinued line drops off the site by itself.

RECORD ORDER what the site sends

FIELD	TYPE	NOTES
order_number	text	The WooCommerce number, so the sheet and the till agree.
placed_at	date and time	
customer_name	text	For the delivery call.
phone, email	text	
fulfilment	delivery / collection	
day	date	The chosen day from the checkout calendar; blank for earliest.
postcode	text	Blank on collection.
lines	list	One or more of: code, quantity, unit (pallet, box, slab, bucket), and for a split mixed pack the count of each slab size.
notes	text	Access notes from the checkout.

REPLY what the script sends back

FIELD	TYPE	NOTES
ok	yes / no	
reason	text	Only when not ok, worded so the site can show it: "only 2 pallets of Raj Green available".

WHAT STAYS FIXED, WHAT CAN CHANGE

Fixed: the web app address, the shared secret, the names of the two entry points, and the field names above.

Free to change: everything else in the script and the sheet: columns, tabs, formulas, roles, layout. If a fixed thing must change, add the new version alongside the old and say so in the Changelog before the old one goes.
